

AMENDMENTS TO THE CLAIMS

Please cancel claim 1, amend claims 2-11, and add claims 12 as follows:

1. (Cancelled).
2. (Currently Amended) [[A]] The method according to claim 12, wherein the temporal occurrence is selected from an age of the biological functional entity and a period during which that functional entity is active.
3. (Currently Amended) [[A]] The method according to claim 12 or claim 2, wherein said ~~biological~~ biochemical constituent is selected from an organism, a tissue, a cell, an organite, and a molecule.
4. (Currently Amended) [[A]] The method according to ~~any-preceding~~ claim 12, wherein said transformation is selected from a cellular transformation and a molecular transformation.
5. (Currently Amended) [[A]] The method according to ~~any-preceding~~ claim 12, wherein said transformation is a molecular transformation selected from: a covalent molecular transformation, itself selected from a covalent transformation of proteins corresponding to a post-traductional transformation or a co-traductional transformation, a covalent RNA transformation corresponding to RNA synthesis or maturation, and a covalent DNA transformation corresponding to DNA synthesis, damage or repair; and a non-covalent transformation itself selected from a hydrophobic transformation, a transformation caused by Van der Waals forces, electrostatic forces or attraction between an electronegative atom of one molecule and a hydrogen atom of another molecule, and a steric transformation caused by attraction between adjacent atoms.
6. (Currently Amended) [[A]] The method according to ~~any-preceding~~ claim 12, wherein some of said function biological entities are included in a higher biological functional entity.

7. (Currently Amended) [[A]] The method according to ~~any-preceding~~ claim 12,
wherein at least some of said biological functional entities include lower biological functional
entities.

8. (Currently Amended) [[A]] The method according to ~~any-preceding~~ claim 12,
wherein at least some functional entities constitute the environment of at least some other
functional entities with which they interact.

9. (Currently Amended) [[A]] The method according to ~~any-preceding~~ claim 12,
wherein the biological system further comprises intangible biological functional entities
modeled by temporal occurrences and where applicable spatial and morphological
occurrences.

10. (Currently Amended) [[A]] The method according to claim 9, wherein said
intangible biological functional entities comprise biochemical reactions.

11. (Currently Amended) A model for implementing a method according to ~~any~~
~~preceding~~ claim 12, the model comprising one or more tangible biological functional entities
modeled by at least: a morphological occurrence comprising at least a biochemical
constituent that identifies the biological functional entity, and at least a transformation
representing the way in which that constituent behaves as a function of the space-time
context; a spatial occurrence representing at least a spatial characteristic of the biological
functional entity; and a temporal occurrence representing at least a temporal characteristic of
the biological functional entity.

12. (New) A method of simulating a transformation in a biological system, the
method comprising:

- modeling the biological system by one or more data represented tangible biological
functional entities, the state of each tangible biological entity being represented by values
assigned to occurrences in a metamodel comprising:

- a morphological occurrence comprising at least a biochemical constituent that
identifies one or more persistent properties of the biological functional entity, and at

least a morphological transformation representing the way in which the biochemical constituent behaves as a function of the space-time context;

a spatial occurrence representing at least a spatial characteristic of the biological functional entity; and

a temporal occurrence representing at least a temporal characteristic of the biological functional entity; and

- representing the behavior of the biological system over time by the trajectory of the states of each data represented biological functional entity in a frame of reference consisting of shape, time, and space, by recursively determining, for each data represented biological functional entity, the effects of the changes in the values assigned to the occurrence on the functioning of the biological functional entity.
